To Sow & Grow

For greenhouse crops sow indoors, a warm kitchen windowsill is all you need for starting these seeds. Sow 0.5cm (1/4") deep, thinly in a pot of compost. Water well and place in a warm position. A temperature of 15-20°C (60-68°F) is ideal. Keep moist. Seedlings usually appear in 7-14 days. Transplant to individual pots when 10-15cm (4-6") tall. Grow on in cooler, but not cold conditions. Plant out April to May, to large pots, growing bags or greenhouse border. Provide support, pinch out side shoots regularly and pinch out growing tip after 5-6 trusses have set.

For outdoor crops delay indoor sowing until March or April. Gradually accustom plants to outside conditions (avoid frosts), before planting out 40cm (16") apart, when frosts are over. Harvest from August onwards.

Mr. F's Tips: This award winning variety is a classic for salads because of the novel appearance but it is also excellent cooked.
